### BACKGROUND INFORMATION

---

CD11c (Integrin  $\alpha$ X, CR4, p150) is a ~150 kDa type I transmembrane glycoprotein that pairs non-covalently with  $\beta$ 2 integrin (CD18) to form the  $\alpha$ X $\beta$ 2 heterodimer. It is expressed mainly on dendritic cells, with additional expression on NK cells, subsets of intestinal intraepithelial lymphocytes, monocytes/macrophages, granulocytes, and some activated T and B cells. CD11c/CD18 binds iC3b, fibrinogen, and CD54 (ICAM-1), mediating cell-cell adhesion, phagocytosis of opsonized particles, and immune cell trafficking.
